1914 Compound Perforations—Scott 423A-423E

THE TRANSITION FROM PERF 12 TO 10 BEGAN AT THE BUREAU OF Engraving and Printing after the arrival of the new 10-gauge perforating wheels in December 1913. The reason for making the change was the Post Office Department's desire to strengthen the sheets of stamps, which had been perforated with 12 holes per 2 centimeters since 1861. Switching to Perf 10 made the sheets easier to handle and less likely to break apart. However, the Perf 10 holes were too far apart, and in response to complaints about the difficulty in separating stamps, the gauge was further modified to Perf 11 in 1917.

Sheets of the Washington-Franklin regular issues were perforated on straight-line perforating machines, which required two passes, horizontal and vertical. With each pass, the perforating wheels punched holes between the rows, and the cutting wheel divided the sheet along the guide line. If the same machine and gauge were used for both passes, the perf gauge would be the same in both directions. However, if a different gauge were used for the second pass, then the result would be “compound” perforations. Evidently, this occurred during the transition from Perf 12 to 10.

For many years, the *Scott Catalogue* listed the 1914 Compound Perforation stamps as varieties of their Perf 10 counterparts. Then, with publication of the 2003 edition, the Compound Perfs were elevated to Major Scott Number status. An article written by Larry S. Weiss in the 2003 *U.S. Specialized Catalogue* concluded “Thus, students overwhelmingly agree that the compound perfs simply were not errors but rather regular production stamps...they should be cataloged as major numbers.” James Kloetzel, the catalogue editor, added “it is entirely consistent with current Scott policy that regular production stamps having perforation differences of ½ gauge or more in either direction qualify for major number listing...These new, major numbers will appear in the Scott National, Minuteman and Pony Express albums...” A photo of the National album page sent with the 2002 supplement appears here.

The Chesapeake collection of 1914 Compound Perforations was started well before the Scott Catalogue listings for 423A-423E were created. It is, without question, the most comprehensive study of these issues ever formed, featuring the unique unused 2c Perf 12 x 10, the earliest recorded use of any Compound Perf, the only recorded used block of any Compound Perf, one of three recorded usages of a Compound Perf, and a diverse range of cancellations and precancels. The only stamp not represented in the collection is the only known 2c Perf 10 x 12, Scott 423E, which is closely held by a collector.

To appreciate the significance of this sale, imagine an auction devoted to the rare 1868 Z Grills soon after they were elevated from varieties of E Grills to major Scott numbers. As collectors try to fill the spaces allocated to Scott 423A-423E, the value of Compound Perfs will begin to reflect their rarity. Our census at the end of this catalogue, compiled by John Zuckerman, will assist philatelists in determining the rarity of these stamps.

However, Bureau records show that the Perf 10 wheels arrived in December 1913, and the earliest documented use of a stamp from the Perf 10 booklet pane is December 20, 1913. Three other dated usages are known of Scott 423A. One is a cover bearing a defective vertical pair, dated August 7, 1914. The second is a postcard, dated December 20, 1914. The last is another postcard, ex Zoellner, dated December 23, 1914 (lot 161 in this sale).

VERY FINE AND CHOICE. THE UNIQUE UNUSED EXAMPLE OF THE 1914 2-CENT PERF 12 x 10 WASHINGTON ISSUE. ONE OF THE GREATEST RARITIES OF 20TH CENTURY UNITED STATES PHILATELY.

Since becoming a major Scott Catalogue number and having its own space allocated in the Scott National Album, this stamp has become **the key to a complete unused collection** of United States stamps. Collectors should note that *no unused examples* are known of the rare Scott 596 (12 recorded) and Scott 613 (43 recorded). One can only speculate how much an unused copy of either of those famously rare stamps would bring if discovered today. In the case of Scott 423B, of which only 29 are recorded (this being the only known unused example), its auction value as a major Scott number will be established for the first time in this sale. We believe that the price, at any level, will be the benchmark for this stamp.

EXTREMELY FINE. EASILY ONE OF THE FINEST OF ONLY SEVEN RECORDED SOUND EXAMPLES OF THE 1914 5-CENT WASHINGTON PERF 12 x 10.

For no apparent reason, the 5c has the highest percentage of faulty stamps of any of the 1914 Compound Perf issues. Of the 24 used copies in our census, seventeen are either faulty or have the perforations in on at least one side of the design. The stamp offered here is one of the finest.

END OF SALE — THANK YOU

1914 COMPOUND PERFORATIONS, SCOTT 423A-423E

Census Compiled by John Zuckerman

The structure of each census number is shown above. When available, previous sale and certification records accompany each stamp. The certification record includes condition notes printed on the certificate and appears in quotes after the certificate number. However, condition changes. Stamps once thought sound can be judged to have an existing fault or can be damaged after the certificate is issued. Likewise, stamps once thought to be faulty may be judged to be sound at a later date. Examples of the latter include a small wrinkle once interpreted as a sealed tear and a small stain that disappeared when soaked in water. Users of this census must understand that the information in quotes is the opinion of the expertizing body at the time of issue.
